Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotExceptionAtTheRateExceptionDomainException

A typical email address should have a " . " character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

Input Format

The first line of input contains the email to be validated.

Output Format

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

Sample Test Case

Input: sample@gmail.com
Output: Valid email address

Answer

```java
import java.util.*;

class DotException extends Exception {
    public DotException(String message) {
        super(message);
    }
}

class AtTheRateException extends Exception {
    public AtTheRateException(String message) {
        super(message);
    }
}

class DomainException extends Exception {
    public DomainException(String message) {
        super(message);
    }
}

public class Main {
    public static void validateEmail(String email) throws DotException,
AtTheRateException, DomainException {
        // Check for exactly one '@'
        int atCount = 0;
        for (char c : email.toCharArray()) {
            if (c == '@') {
                atCount++;
            }
        }

        if (atCount != 1) {
```

```java
            throw new AtTheRateException("Invalid @ usage");
        }

        // Split by '@'
        String[] parts = email.split("@");
        String domainPart = parts[1];

        // Check if email ends with '.'
        if (email.endsWith(".")) {
            throw new DotException("Invalid Dot usage");
        }

        // Check for exactly one '.' in domain part
        int dotCount = 0;
        for (char c : domainPart.toCharArray()) {
            if (c == '.') {
                dotCount++;
            }
        }

        if (dotCount != 1) {
            throw new DotException("Invalid Dot usage");
        }

        // Extract domain extension
        int lastDotIndex = domainPart.lastIndexOf('.');
        String extension = domainPart.substring(lastDotIndex + 1);

        // Validate domain extension
        if (!extension.equals("in") && !extension.equals("com") && !
extension.equals("net") && !extension.equals("biz")) {
            throw new DomainException("Invalid Domain");
        }
    }

    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String email = sc.nextLine();

        try {
            validateEmail(email);
            System.out.println("Valid email address");
```

```java
    } catch (DotException e) {
        System.out.println("DotException: " + e.getMessage());
        System.out.println("Invalid email address");
    } catch (AtTheRateException e) {
        System.out.println("AtTheRateException: " + e.getMessage());
        System.out.println("Invalid email address");
    } catch (DomainException e) {
        System.out.println("DomainException: " + e.getMessage());
        System.out.println("Invalid email address");
    }
  }
}
```

Status : Correct   *Marks : 10/10*
